

## Projeto Final da Disciplina Infraestrutura MongoDB – Pós Graduação MIT em Engenharia de dados: Big Data

Prof.: Carlos Eduardo Gertners

### **Conceitos**

1.

#### **Diferenças:**

Modelo de dados

SQL: Utiliza um modelo de dados relacional, onde os dados são organizados em tabelas com esquemas predefinidos.

NoSQL: Pode ter modelos de dados variados, incluindo documentos, chave-valor, grafos, famílias de colunas e etc.

Escalabilidade

No SQL a escalabilidade é vertical, ou seja, para aumentar o desempenho você tem que melhorar o processamento, memória e etc, daquela máquina.

No noSQL para o aumento do desempenho, basta vc adicionar mais n[os, ou seja, adicionar outra máquina na mesma configuração da outra.

Consistência vs. Desempenho:

SQL: Oferece garantia de consistência forte devido ao modelo ACID.

NoSQL: Muitas vezes sacrifica a consistência em prol do desempenho, seguindo o modelo CAP (Consistência, Disponibilidade, Tolerância a Partições).

## **Semelhanças:**

### Armazenamento de Dados:

Ambos os tipos de bases de dados são projetados para armazenar dados de forma persistente. A principal diferença está na maneira como esses dados são modelados e acessados.

### Manipulação de Dados:

Tanto em SQL quanto em NoSQL, você pode realizar operações CRUD (Create, Read, Update, Delete) para manipular os dados armazenados.

### Índices:

Ambos suportam índices para melhorar o desempenho de consultas. Os índices são usados para acelerar a recuperação de dados em consulta.

## **2.**

Não existe um modelo melhor ou pior, e sim irá depender do tipo do negócio para analisarmos qual das bases fará mais sentido.

Se for algo com diferentes tipos de dados, o noSQL se encaixa melhor; se for algo que requer uma consistência alta, o modelo SQL entregará mais.

## **3.**

### NoSQL

Pra extração de dados oriundo de streaming, rede social, pela diversidade de dado optaria por um modelo noSQL.

### SQL

Para criação por exemplo de algum sistema bancário, usaria o SQL por sua forte característica de consistência.

## **4.**

Existe uma série de tipos de banco de dados noSQL atualmente mercado, mas as principais categorias, são:

- Documentos → MongoDB
- Colunar → Cassandra
- Chave-valor → Redis
- Grafos → Neo4j

## Documentos

Os dados são documentos, flexíveis e semiestruturados, permitindo alteração conforme a necessidade. Os documentos são estruturas de chave e valor.

## Colunar

Faz o armazenamento dos dados em linhas e permite consulta com base em colunas específicas.

## Chave-valor

Os dados são armazenados na forma de chave valor como tabelas hash. Não há tabelas e não há uma maneira definida para relacionar os dados.

## Grafos

O grafo é uma estrutura composta por uma série de nós que podem ser conectados por arestas. Redes sociais e mapas de cidades, utilizam grafo.

# Prática

Criação do Data Base.

```
> use rr_rh
switched to db rr_rh
> show dbs
admin    0.000GB
config  0.000GB
local    0.000GB
>
> db
rr_rh
>
>
```

## Criação das collections

```
>
>
>
> db.createCollection("rr_funcionario")
{ "ok" : 1 }
> db.createCollection("rr_departamento")
{ "ok" : 1 }
> db.createCollection("rr_dependente")
{ "ok" : 1 }
>
> show collections
rr_departamento
rr_dependente
rr_funcionario
>
```

Inserindo documentos da collection rr\_departamento.

```
> db.rr_departamento.insertMany([
...   {
...     cod: 1,
...     nome: "Pesquisa",
...     localizacao: "São Paulo"
...   },
...   {
...     cod: 2,
...     nome: "Engenharia",
...     localizacao: "Rio de Janeiro",
...     bairro: "Centro"
...   },
...   {
...     cod: 3,
...     nome: "Admininstracao",
...     localizacao: "Belo Horizonte"
...   }
... ])
{
  "acknowledged" : true,
  "insertedIds" : [
    ObjectId("658112bd76df72522fa4ec03"),
    ObjectId("658112bd76df72522fa4ec04"),
    ObjectId("658112bd76df72522fa4ec05")
  ]
}
> show dbs
admin    0.000GB
config  0.000GB
local    0.000GB
rr_rh    0.000GB
> db.rr_departamento.find()
{ "_id" : ObjectId("658112bd76df72522fa4ec03"), "cod" : 1, "nome" : "Pesquisa", "localizacao" : "São Paulo" }
{ "_id" : ObjectId("658112bd76df72522fa4ec04"), "cod" : 2, "nome" : "Engenharia", "localizacao" : "Rio de Janeiro", "bairro" : "Centro" }
{ "_id" : ObjectId("658112bd76df72522fa4ec05"), "cod" : 3, "nome" : "Admininstracao", "localizacao" : "Belo Horizonte" }
```

Inserindo documentos da collection rr\_funcionário.

```
> db['rr_funcionario'].insertMany([
...   {
...     "cod": 101,
...     "nome": "Rafael",
...     "cargo": "Engenheiro",
...     "salario": 10000
...   },
...   {
...     cod: 102,
...     nome: "Fernanda",
...     cargo: "Analista",
...     salario: 8000,
...     Endereco: " Rua João Gomes 10"
...   },
...   {
...     cod: 103,
...     nome: "Roberta",
...     cargo: "Administradora",
...     salario: 7500
...   }
... ])
{
  "acknowledged" : true,
  "insertedIds" : [
    ObjectId("6581170476df72522fa4ec09"),
    ObjectId("6581170476df72522fa4ec0a"),
    ObjectId("6581170476df72522fa4ec0b")
  ]
}

> db.rr_funcionario.find()
{ "_id" : ObjectId("6581170476df72522fa4ec09"), "cod" : 101, "nome" : "Rafael", "cargo" : "Engenheiro", "salario" : 10000 }
{ "_id" : ObjectId("6581170476df72522fa4ec0a"), "cod" : 102, "nome" : "Fernanda", "cargo" : "Analista", "salario" : 8000, "Endereco" : " Rua João Gomes 10" }
{ "_id" : ObjectId("6581170476df72522fa4ec0b"), "cod" : 103, "nome" : "Roberta", "cargo" : "Administradora", "salario" : 7500 }
```

Inserindo documentos na collection rr\_dependente.

```
> db.rr_dependente.insertMany([
...   {
...     cod: 201,
...     nome: "Ana",
...     relacao: "Filha"
...   },
...   {
...     cod: 202,
...     nome: "Pedro",
...     relacao: "Filho",
...     maior_idade: "Nao"
...   },
...   {
...     cod: 203,
...     nome: "Mariana",
...     relacao: "Filha"
...   }
... ])
{
  "acknowledged" : true,
  "insertedIds" : [
    ObjectId("65811aae76df72522fa4ec0f"),
    ObjectId("65811aae76df72522fa4ec10"),
    ObjectId("65811aae76df72522fa4ec11")
  ]
}
> db.rr_dependente.find()
{ "_id" : ObjectId("65811aae76df72522fa4ec0f"), "cod" : 201, "nome" : "Ana", "relacao" : "Filha" }
{ "_id" : ObjectId("65811aae76df72522fa4ec10"), "cod" : 202, "nome" : "Pedro", "relacao" : "Filho", "maior_idade" : "Nao" }
{ "_id" : ObjectId("65811aae76df72522fa4ec11"), "cod" : 203, "nome" : "Mariana", "relacao" : "Filha" }
```

Fazendo um filtro pela descrição da collection rr\_departamento.

```
> db.rr_departamento.find({
...   nome: "Engenharia"
... })
{ "_id" : ObjectId("6581195276df72522fa4ec0d"), "cod" : 2, "nome" : "Engenharia", "localizacao" : "Rio de Janeiro", "bairro" : "Centro" }
```

Fazendo um filtro na collection rr\_funcionario que recebem mais que 7900.

```
> db['rr_funcionario'].find({
...   "salario": { $gt: 7900 }
... })
{ "_id" : ObjectId("6581170476df72522fa4ec09"), "cod" : 101, "nome" : "Rafael", "cargo" : "Engenheiro", "salario" : 10000 }
{ "_id" : ObjectId("6581170476df72522fa4ec0a"), "cod" : 102, "nome" : "Fernanda", "cargo" : "Analista", "salario" : 8000, "Endereco" : "Rua João Gomes 10" }
```

Aplicando o distinct na collection rr\_dependente para retornar todos os valores diferentes da chave “nome”.

```
>
>
> db.rr_dependente.distinct("nome")
[ "Ana", "Pedro", "Mariana" ]
>
>
>
```

Update na coleção rr\_departamento

```
> db.rr_departamento.update(
...   { cod: 2 },
...   {
...     $set: {
...       localizacao: "Santa Catarina",
...       extra_atributo: "Florianopolis"
...     }
...   }
... )
WriteResult({ "nMatched" : 1, "nUpserted" : 0, "nModified" : 1 })
>
> db.rr_departamento.find()
{ "_id" : ObjectId("65822f3230f4e827b24141d2"), "cod" : 1, "nome" : "Pesquisa", "localizacao" : "São Paulo" }
{ "_id" : ObjectId("65822f3230f4e827b24141d3"), "cod" : 2, "nome" : "Engenharia", "localizacao" : "Santa Catarina", "bairro" : "Centro", "extra_atributo" : "Florianopolis" }
{ "_id" : ObjectId("65822f3230f4e827b24141d4"), "cod" : 3, "nome" : "Admininstracao", "localizacao" : "Belo Horizonte" }
>
<
```

Remoção da coleção rr\_dependente

```
>
> db.rr_dependente.drop()
true
>
>
> show collections
rr_departamento
rr_funcionario
>
>
```

## Modelagem

Cardinalidade 1-N

```
> db
rr_modelo
>
>
> db.rr_colla.insertMany([
...   {
...     id: 1,
...     livro: "Mindset",
...     autora: "Carol Dweck"
...   },
...   {
...     id: 2,
...     livro: "Trading in the Zone",
...     autor: "Mark Douglas"
...   }
... ])
{
  "acknowledged" : true,
  "insertedIds" : [
    ObjectId("65823c3ee835f0f91d3986c9"),
    ObjectId("65823c3ee835f0f91d3986ca")
  ]
}
```

```

> db.rr_col2a.insertMany([
...   {
...     id: 104,
...     colla_id: 1,
...     detalhe: "Para Psicologos"
...   },
...   {
...     id: 105,
...     colla_id: 1,
...     detalhe: "Para Pscicologos"
...   },
...   {
...     cod: 106,
...     colla_id: 2,
...     detalhe: "Para Tarders"
...   },
...   {
...     cod: 107,
...     colla_id: 2,
...     detalhe: "Para Traders"
...   }
... ])
{
  "acknowledged" : true,
  "insertedIds" : [

    ObjectId("65823d4ae835f0f91d3986d2")
  ]
}

```

Cardinalidade N-N por referência

Criação da collection cliente

```

> db.rr_clientes.insertMany([
...   {
...     id: 1,
...     nome: "João",
...     endereco: "Rua 1920"
...   },
...   {
...     id: 2,
...     nome: "Rafael",
...     endereco: "Rua 2028"
...   }
... ])
{
  "acknowledged" : true,
  "insertedIds" : [
    ObjectId("65824776e835f0f91d3986d6"),
    ObjectId("65824776e835f0f91d3986d7")
  ]
}

```

Criação da collection pedidos

```
> db.rr_pedidos.insertMany([
...   {
...     cod_prod: 101,
...     cliente_id: 1,
...   },
...   {
...     id: 102,
...     cliente_id: 2,
...   }
... ])
{
  "acknowledged" : true,
  "insertedIds" : [
    ObjectId("65824788e835f0f91d3986d8"),
    ObjectId("65824788e835f0f91d3986d9")
  ]
}
```

Criação da collection itens

```
> db.rr_itens.insertMany([
...   {
...     id: 1001,
...     descricao: "caneta",
...     preco: 2.99
...   },
...   {
...     id: 1002,
...     descricao: "lapis",
...     preco: 1.99
...   },
...   {
...     id: 1003,
...     descricao: "borracha",
...     preco: 0.99
...   }
... ])
{
  "acknowledged" : true,

>

```

Criamos a instância de segurança, conectamos na mesma, vimos que pelo erro apresentado no database segurança, que nós não temos privilégio para executar o comando show dbs.

Criamos o database admin, conectamos, criamos através da variável 'userdba', para posteriormente criarmos o usuário dba com a senha e seus devidos privilégios de acesso.

```

ubuntu 79748 1 3 21:01 ? 00:00:02 mongod --fork --logpath /home/ubuntu/log/mongod_segur.log --dbpath=/home/ubuntu/segur --port 30000 --auth

> db.createUser (usuariodesenv)
Successfully added user: { "user" : "rr_rafael", "roles" : [ "readWrite" ] }

```

Acessando com as credenciais do usuário rr\_rafael.

```
ubuntu@ubuntu2004:~$ mongo localhost:30000/rr_rh -u rr_rafael -p rafadev
MongoDB shell version v3.6.8
connecting to: mongodb://localhost:30000/rr_rh
Implicit session: session { "id" : UUID("cfdc6a5b-492f-4c9c-94f2-32676ffa0fde") }
MongoDB server version: 3.6.8
>
>
> db
rr_rh
```

Inserindo uma coleção através do usuário rr\_rafael.

```
> db.rr_funcionarios.insert({ nome: "Roberta", setor: "Financeiro"})
db.rr_funcionarios.insert({ nome: "Rafael", setor: "Engenharia"})
db.rr_funcionarios.insert({ nome: "Juliana", setor: "Pesquisa"})
db.rr_funcionarios.insert({ nome: "Lucas", setor: "Desenvolvimento"})WriteResult({ "nInserted" : 1 })
> db.rr_funcionarios.insert({ nome: "Rafael", setor: "Engenharia"})
WriteResult({ "nInserted" : 1 })
> db.rr_funcionarios.insert({ nome: "Juliana", setor: "Pesquisa"})
WriteResult({ "nInserted" : 1 })
> db.rr_funcionarios.insert({ nome: "Lucas", setor: "Desenvolvimento"})
WriteResult({ "nInserted" : 1 })
>
>
> show collections
rr_funcionarios
>
> db.rr_funcionarios.find()
{ "_id" : ObjectId("65865491f404abebb9cfc5ad"), "nome" : "Roberta", "setor" : "Financeiro" }

```

## Depuração, Backup/Restore

Abaixo nós criamos o diretório tuning e a instância.

```
ubuntu@ubuntu2004:~$ mkdir /home/ubuntu/tuning
ubuntu@ubuntu2004:~$
ubuntu@ubuntu2004:~$ mongod --fork --logpath /home/ubuntu/log/mongodb_tuning.log
--dbpath=/home/ubuntu/tuning --port 32000
about to fork child process, waiting until server is ready for connections.
forked process: 80375
child process started successfully, parent exiting
ubuntu@ubuntu2004:~$ ps -ef | grep -i mongo | grep -iv grep
ubuntu      80375      1   9 09:58 ?           00:00:01 mongod --fork --logpath /hom
e/ubuntu/log/mongodb_tuning.log --dbpath=/home/ubuntu/tuning --port 32000
ubuntu@ubuntu2004:~$
ubuntu@ubuntu2004:~$
```

Conectamos localmente via porta 32000 no db\_tuning, verificamos o db corrente e fomos para o db rr\_ideagreg.

```
ubuntu@ubuntu2004:~$ mongo localhost:32000/db_tuning
MongoDB shell version v3.6.8
connecting to: mongodb://localhost:32000/db_tuning

{ "_id" : ObjectId("65870062e81cfbc2541c5d24"), "cod_ddi" : "+20", "nome" : "Egito", "continente" : "Africano" }
>
```

Aqui fizemos uma consulta filtrando pelo continente e usando o método explain.

Podemos verificar em winningPlan que foi feito um COLLSCAN, ou seja, para retornar a consulta foi necessário verificar linha por linha da coluna continente, isso porque não há índice nenhum criado na mesma.

```
> db.rr_Paises.find({continente:"Sul Americano"}).explain()
{
  "queryPlanner" : {
    "plannerVersion" : 1,
    "namespace" : "rr_ideagreg.rr_Paises",
    "indexFilterSet" : false,
    "parsedQuery" : {
      "continente" : {
        "$eq" : "Sul Americano"
      }
    },
    "winningPlan" : {
      "stage" : "COLLSCAN",
      "filter" : {
        "continente" : {
          "$eq" : "Sul Americano"
        }
      },
      "direction" : "forward"
    },
    "rejectedPlans" : [ ]
  },
  "serverInfo" : {
    "host" : "ubuntu2004",
    "port" : 32000,
    "version" : "3.6.8",
    "gitVersion" : "8e540c0b6db93ce994cc548f000900bdc740f80a"
  },
  "ok" : 1
}
```

Criação do índice na coluna continente como 1, ou seja, ascendente.

```
> db.rr_Paises.createIndex ( { continente : 1 } )
{
  "createdCollectionAutomatically" : false,
  "numIndexesBefore" : 1,
  "numIndexesAfter" : 2,
  "ok" : 1
}
```

Aplicando novamente o mesmo comando anteriormente, podemos verificar dessa vez em winningPlan, que o foi realizado um IXSCAN, ou seja, foi utilizado nosso índice criado, para que nossa consulta tenha um desempenho significativamente melhor.

```
db.rr_Paises.find({continente:"Sul Americano"}).explain()

{
  "queryPlanner" : {
    "plannerVersion" : 1,
    "namespace" : "rr_ideagreg.rr_Paises",
    "indexFilterSet" : false,
    "parsedQuery" : {
      "continente" : {
        "$eq" : "Sul Americano"
      }
    },
    "winningPlan" : {
      "stage" : "FETCH",
      "inputStage" : {
        "stage" : "IXSCAN",
        "keyPattern" : {
          "continente" : 1
        },
        "indexName" : "continente_1",
        "isMultiKey" : false,
        "multiKeyPaths" : {
          "continente" : [ ]
        },
        "isUnique" : false,
        "isSparse" : false,
        "isPartial" : false,
        "indexVersion" : 2,
        "direction" : "forward",
        "indexBounds" : {
          "continente" : [
            ["Sul Americano\","Sul Americano\"]
          ]
        }
      }
    }
  }
}
```

## Mongostat

Na parte superior do print, conectamos localmente pela porta 32000 no db\_tuning e na tela de baixo, chamamos o mongostat que é uma ferramenta do MongoDB para acompanhamento em tempo real de gravações, informações de CPU, memória e etc.

Inserimos a coleção rr\_Numero1, com 50000 documentos e podemos notar pelo mongostat na coluna net\_in o salto de dados de bytes para kbytes.

```
ubuntu@ubuntu2004:~$
ubuntu@ubuntu2004:~$ mongo localhost:32000/db_tuning
